

1 Interpolation with AMR

GR Tedyn has several plots of land (cells) for planting (interpolating)

2 Preparation

To facilitate the process

GR Tedyn hired :

(i) N supervisors

(ii) N gardeners

Gardeners report to the supervisors.

3 Where to interpolate?

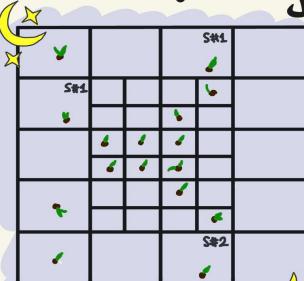

.	.	Supervisor #1	.
Supervisor #1	.	.	.
.	.	.	.
.	.	.	.
.	.	Supervisor #2	.

Each supervisor picks a random seed from a bag and drops it in a chosen plot of land.

$\times N$

4 A magical Spell

At night, an agricultural (interpolating) wizard comes to the planted plots of land.

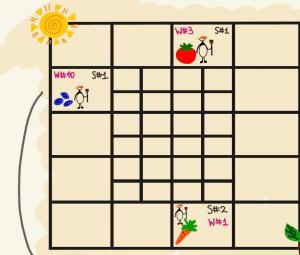

Quasimodo Lagrangeus!

Suddenly, all the crops start to grow!

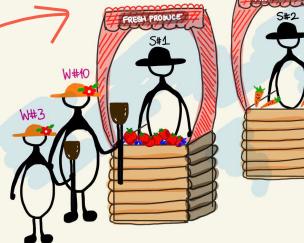

5 Communicate

In the day, Redistribute() function is called : each gardener is sent to their plot of land to find out what has grown on it and report it to the supervisor, who planted that seed.

Worker #10 reports "blueberries" to supervisor #1.
Worker #10 reports "carrot" to supervisor #2.

6 Finalise

Finally, the fruits and vegetables (interpolated points) are sold at the market (prepared for writing to a file).
